## Variables and Data Types

## Variable Assignment

>>>	x=5
>>>	X
5	

## Calculations With Variables

Sum of two variables
Subtraction of two variables
Multiplication of two variables
Exponentiation of a variable
Remainder of a variable
Division of a variable

## Types and Type Conversion

str()	'5', '3.45', 'True'	Variables to strings
int()	5, 3, 1	Variables to integers
float()	5.0, 1.0	Variables to floats
bool()	True, True, True	Variables to booleans

## **Asking For Help**

>>> help(str)

## Strings

```
>>> my string = 'thisStringIsAwesome'
>>> my string
'thisStringIsAwesome'
```

## **String Operations**

```
>>> my string * 2
 'thisStringIsAwesomethisStringIsAwesome'
>>> my string + 'Innit'
 'thisStringIsAwesomeInnit'
>>> 'm' in my string
```

### Lists

```
>>> a = 'is'
>>> b = 'nice'
>>> my list = ['my', 'list', a, b]
>>>  my list2 = [[4,5,6,7], [3,4,5,6]]
```

### **Selecting List Elements**

### Index starts at o

Also see NumPy Arrays

### Subset

```
>>> my list[1]
>>> my list[-3]
Slice
```

- >>> my list[1:3] >>> my list[1:] >>> my list[:3] >>> my list[:]
- **Subset Lists of Lists** >>> my list2[1][0]
- >>> my list2[1][:2]

### Select item at index 1 Select 3rd last item

Select items at index 1 and 2 Select items after index o Select items before index 3 Copy my list

my list[list][itemOfList]

### **List Operations**

```
>>> my list + my list
['my', 'list', 'is', 'nice', 'my', 'list', 'is', 'nice']
>>> my list * 2
['my', 'list', 'is', 'nice', 'my', 'list', 'is', 'nice']
>>> <del>my list2 > 4</del>
                           error
```

### **List Methods**

Get the index of an item
Count an item
Append an item at a time
Remove an item
Remove an item
Reverse the list
Append an item
Remove an item
Insert an item
Sort the list

## String Operations

### Index starts at o

```
>>> my string[3]
>>> my string[4:9]
```

## String Methods

ourning infocutous	
>>> my_string.upper()	String to uppercase
>>> my string.lower()	String to lowercase
>>> my_string.count('w')	Count String elements
>>> my_string.replace('e', '	' i ' ) Replace String elements
>>> mv string.strip()	Strip whitespaces

### Libraries

### **Import libraries**

>>> import numpy

>>> import numpy as np Selective import

>>> from math import pi

### pandas 🖳 💥 🕍 Data analysis

Machine learning

NumPy Scientific computing

**4** matplotlib 2D plotting

## **Install Python**

Leading open data science platform powered by Python

with Anaconda

Create and share documents with live code. visualizations, text. ...

## **Numpy Arrays**

### Also see Lists

```
>>>  my list = [1, 2, 3, 4]
>>> my array = np.array(my list)
>>> my 2 \text{darray} = \text{np.array}([[1,2,3],[4,5,6]])
```

## Selecting Numpy Array Elements

### Index starts at o

```
Subset
>>> my array[1]
```

Slice

```
>>> my array[0:2]
  array([1, 2])
Subset 2D Numpy arrays
```

>>> my 2darray[:,0] array([1, 4])

Select item at index 1

Select items at index 0 and 1

my 2darray[rows, columns]

## Numpy Array Operations

```
>>> my array > 3
 array([False, False, False, True], dtype=bool)
>>> my array * 2
  array([2, 4, 6, 8])
>>> my array + np.array([5, 6, 7, 8])
 array([6, 8, 10, 12])
```

## Numpy Array Functions

```
>>> my array.shape
                                      Get the dimensions of the array
>>> np.append(other array)
                                      Append items to an array
>>> np.insert(my array, 1, 5)
                                      Insert items in an array
>>> np.delete(my array,[1])
                                      Delete items in an array
>>> np.mean(my array)
                                      Mean of the array
                                      Median of the array
>>> np.median(my array)
                                      Correlation coefficient
>>> my array.corrcoef()
>>> np.std(my array)
                                      Standard deviation
```

# NumPv Basics

Learn Python for Data Science Interactively at <a href="www.DataCamp.com">www.DataCamp.com</a>

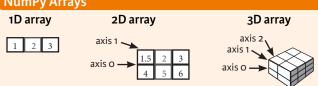

## NumPy

The **NumPy** library is the core library for scientific computing in Python. It provides a high-performance multidimensional array object, and tools for working with these arrays.

Use the following import convention: >>> import numpy as np

## **NumPy Arrays**

## **Creating Arrays**

```
>>> a = np.array([1,2,3])
>>> b = np.array([(1.5,2,3), (4,5,6)], dtype = float)
>>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]],
                 dtype = float)
```

### **Initial Placeholders**

>>> np.zeros((3,4))	Create an array of zeros
>>> np.ones((2,3,4),dtype=np.int16)	Create an array of ones
>>> d = np.arange(10,25,5)	Create an array of evenly
	spaced values (step value)
>>> np.linspace(0,2,9)	Create an array of evenly
	spaced values (number of samples)
>>> e = np.full((2,2),7)	Create a constant array
>>> f = np.eye(2)	Create a 2X2 identity matrix
>>> np.random.random((2,2))	Create an array with random values
>>> np.empty((3,2))	Create an empty array

## 1/0

## Saving & Loading On Disk

```
>>> np.save('my array', a)
>>> np.savez('array.npz', a, b)
>>> np.load('my array.npy')
```

## Saving & Loading Text Files

>>>	np.loadtxt("myfile.txt")
>>>	<pre>np.genfromtxt("my_file.csv", delimiter=',')</pre>
>>>	<pre>np.savetxt("myarray.txt", a, delimiter=" ")</pre>

## **Data Types**

>>> np.int64	Signed 64-bit integer types
>>> np.float32	Standard double-precision floating point
>>> np.complex	Complex numbers represented by 128 floats
>>> np.bool	Boolean type storing TRUE and FALSE values
>>> np.object	Python object type
>>> np.string_	Fixed-length string type
>>> np.unicode_	Fixed-length unicode type

## Inspecting Your Array

>>> a	.shape	Array dimensions
>>> 1	en(a)	Length of array
>>> b	.ndim	Number of array dimensions
>>> e	.size	Number of array elements
>>> b	.dtype	Data type of array elements
>>> b	.dtype.name	Name of data type
>>> b	.astype(int)	Convert an array to a different type

# **Asking For Help**

>>> np.info(np.ndarray.dtype)

## **Array Mathematics**

## **Arithmetic Operations**

>>> g = a - b	Subtraction
array([[-0.5, 0. , 0. ], [-3. , -3. , -3. ]])	
[-3. , -3. , -3. ]]) >>> np.subtract(a,b)	Subtraction
>>> h + a	Addition
array([[ 2.5, 4. , 6. ],	Addition
[5., 7., 9.]])	
>>> np.add(b,a)	Addition
>>> a / b	Division
array([[ 0.66666667, 1. , 1. ]	
	· ·
>>> np.divide(a,b)	Division
>>> a * b	Multiplication
array([[ 1.5, 4., 9.], [ 4., 10., 18.]])	
	Multiplication
>>> np.multiply(a,b)	Multiplication Exponentiation
>>> np.exp(b)	1 .
>>> np.sqrt(b) >>> np.sin(a)	Square root Print sines of an array
>>> np.cos(b)	Element-wise cosine
>>> np.tos(b) >>> np.log(a)	Element-wise natural logarithm
>>> e.dot(f)	_
array([[ 7., 7.],	Dot product
[7., 7.]])	

## Comparison

>>> a == b array([[False, True, True],	Element-wise comparison
<pre>[False, False, False]], dtype=bool) &gt;&gt;&gt; a &lt; 2 array([True, False, False], dtype=bool)</pre>	Element-wise comparison
	Array-wise comparison

## **Aggregate Functions**

>>> a.sum()		Array-wise sum
>>> a.min()		Array-wise minimum value
>>> b.max(axis=0)		Maximum value of an array row
>>> b.cumsum(axis=1	)	Cumulative sum of the elements
>>> a.mean()	11 (1)	Mean
// willoutant	np.median(b)	Median
>>> <del>a.corrcoef()</del> 1	np.corrcoef(a)	Correlation coefficient
>>> np.std(b)		Standard deviation

## **Copying Arrays**

>>> h = a.view()	Create a view of the array with the same data
>>> np.copy(a)	Create a copy of the array
>>> h = a.copy()	Create a deep copy of the array

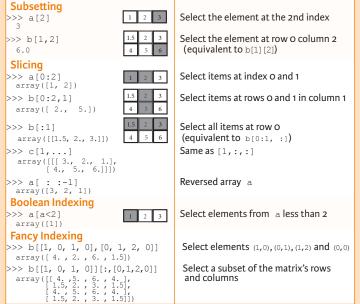

## **Sorting Arrays**

_		
>>		Sort an array
>>	> c.sort(axis=0)	Sort the elements of an array's axis

## Subsetting, Slicing, Indexing

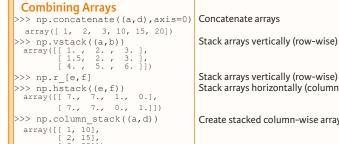

Split the array vertically at the 2nd index

Also see Lists

## **Array Manipulation**

1		
	<pre>Transposing Array &gt;&gt;&gt; i = np.transpose(b) &gt;&gt;&gt; i.T</pre>	Permute array dimensions Permute array dimensions
	<pre>Changing Array Shape &gt;&gt;&gt; b.ravel() &gt;&gt;&gt; g.reshape(3,-2)</pre>	Flatten the array Reshape, but don't change data
	Adding/Removing Elements  >>> in.resize((2,6))  >>> np.append(h,g)  >>> np.insert(a, 1, 5)  >>> np.delete(a,[1])	)) turn a new array with shape (2,6) Append items to an array Insert items in an array Delete items from an array

>>> np.vsplit(c,2)

<pre>&gt;&gt; np.r_[e,f] &gt;&gt; np.hstack((e,f)) array([[ 7., 7., 1., 0.],</pre>	Stack arrays vertically (row-wise) Stack arrays horizontally (column-wise)
[ 7., 7., 0., 1.]])	
>> np.column_stack((a,d))	Create stacked column-wise arrays
array([[ 1, 10],	
>> np.c_[a,d]	Create stacked column-wise arrays
Splitting Arrays	
>> np.hsplit(a,3)	Split the array horizontally at the 3rd
[arrav([1]),arrav([2]),arrav([3])]	index

# **Python For Data Science** Cheat Sheet SciPv - Linear Algebra

Learn More Python for Data Science Interactively at www.datacamp.com

# SciPy

The **SciPy** library is one of the core packages for scientific computing that provides mathematical algorithms and convenience functions built on the NumPy extension of Python.

## **Interacting With NumPy**

### Also see NumPv

```
>>> import numpy as np
>>> a = np.array([1,2,3])
>>> b = np.array([(1+5j,2j,3j), (4j,5j,6j)])
>>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]])
```

### Index Tricks all the input arrays must have same number of dimensions

>>>	np.mgrid[0:5,0:5]		Create a	dense meshgrid
>>>	np.ogrid[0:2,0:2]			n open meshgrid
	np.r_/[3,[0]*5,-1:1:10	H		rays vertically (row-wise)
>>>	np.c_[ <del>b,e]</del>		Create s	tacked column-wise arrays

## Shape Manipulation

>>> np.transpose(b) >>> b.flatten()	Permute array dimensions Flatten the array
>>> np.hstack((b,c))	Stack arrays horizontally (column-wise)
>>> np.vstack((a,b))	Stack arrays vertically (row-wise)
>>> np.hsplit(c,2)	Split the array horizontally at the 2nd inde
>>> np.vpslit (d,2)	Split the array vertically at the 2nd index

### **Polynomials** np.vsplit(c, 2)

		Create a polynomial object
>>>	from numpy import poly1d	

## **Vectorizing Functions**

```
>>> def myfunc(a):
         if a < 0:
           return a*2
         else.
           return a/2
>>> np.vectorize(myfunc)
                                     Vectorize functions
```

## Type Handling

>>>	np.real(c)	Return the real part of the array elements
>>>		Return the imaginary part of the array element
>>>		Return a real array if complex parts close to 0
>>>	np.cast['f'](np.pi)	Cast object to a data type

## Other Useful Functions

>>>	np.angle(b,deg=True)	Return the angle of the cor	
>>>	g = np.linspace(0,np.pi,num=5)	Create an array of evenly sp	paced values
>>>	g [3:] += np.pi	(number of samples)	
>>>	np.unwrap(g)	Unwrap	
>>>	np.logspace(0,10,3)	Create an array of evenly s	paced values (log scale)
>>>	np.select([c<4],[c*2])	from scipy import special	arrays depending on
	_	special.factorial()	
	misc.factorial(a)	special.comb()	
>>>	misc.comb(10,3,exact=True)	Combine is timings taken at	
>>>	misc.central_diff_weights(3)	Weights for Np-point cen	
>>>	misc.derivative(myfunc, 1.0)	Find the n-th derivative of a function at a point	

### Linear Algebra Also see NumPy

You'll use the linalg and sparse modules. Note that scipy. linalg contains and expands on numpy. linalg.

### >>> from scipy import linalg, sparse

## Creating Matrices

>>>	Α	=	<pre>np.matrix(np.random.random((2,2)))</pre>
>>>	В	=	np.asmatrix(b)
>>>	С	=	np.mat(np.random.random((10,5)))
>>>	D	=	np mat([[3.4], [5.6]])

### **Basic Matrix Routines**

### Inverse >>> A T

>>>	linalg.inv(A)
>>>	A.T
>>>	A.H
\\\	nn traco(A)

### Norm

>>>	linalg.norm(A)
>>>	linalg.norm(A,1)
>>>	linalg.norm(A,np.inf)

### Rank

>>> np.linalg.matrix rank(C)

### Determinant

>>> linalg.det(A)

## Solving linear problems

>>>	linalg.solve(A,b)
>>>	E = np.mat(a).T
	linalg.lstsq(D,E)

### **Generalized** inverse

>>>	linalg.pinv(C)
>>>	linalg.pinv2(C)

Inverse Inverse

Tranpose matrix Conjugate transposition Trace

### Frobenius norm

L1 norm (max column sum) L inf norm (max row sum)

### Matrix rank

Determinant

(SVD)

Solver for dense matrices Solver for dense matrices Least-squares solution to linear matrix equation

Compute the pseudo-inverse of a matrix (least-squares solver) Compute the pseudo-inverse of a matrix

## **Creating Sparse Matrices**

ı	>>> F = np.eye(3, k=1)	Create a 2X2 identity matrix
ı	>>> G = np.mat(np.identity(2))	Create a 2x2 identity matrix
ı	>>> C[C > 0.5] = 0	
ı	>>> H = sparse.csr_matrix(C)	Compressed Sparse Row matrix
ı	>>> I = sparse.csc matrix(D)	Compressed Sparse Column matrix
ı	>>> J = sparse.dok matrix(A)	Dictionary Of Keys matrix
ı	>>> E.todense()	Sparse matrix to full matrix
ı	>>> sparse.isspmatrix csc(A)	Identify sparse matrix

## **Sparse Matrix Routines**

# >>> sparse.linalg.inv(I)

Norm			

>>> sparse.linalg.norm(I) Solving linear problems

# >>> sparse.linalg.spsolve(H,I)

Solver for sparse matrices

Inverse

Norm

### Sparse Matrix Functions

>>	<pre>sparse.linalg.expm(I)</pre>	Sparse matrix exponential

>>> M,N = B.shape >>> Sig = linalg.diagsvd(s,M,N)

# LU Decomposition

>>> P, L, U = linalg.lu(C)

Solve ordinary or generalized eigenvalue problem for square matrix Unpack eigenvalues First eigenvector

Second eigenvector Unpack eigenvalues

Singular Value Decomposition (SVD)

Construct sigma matrix in SVD

LU Decomposition

## **Sparse Matrix Decompositions**

>>> la, v = sparse.linalg.eigs(F,1) >>> sparse.linalg.svds(H, 2)

Eigenvalues and eigenvectors SVD

## Asking For Help

>>> help(scipy.linalg.diagsvd) >>> np.info(np.matrix)

## **Pandas Basics**

Learn Python for Data Science Interactively at www.DataCamp.com

## **Pandas**

The **Pandas** library is built on NumPy and provides easy-to-use data structures and data analysis tools for the Python programming language.

## Use the following import convention:

>>> import pandas as pd

### **Pandas Data Structures**

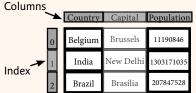

### Series

A one-dimensional labeled array capable of holding any data type

```
>>> s = pd.Series([3, -5, 7, 4], index=['a', 'b', 'c', 'd'])
```

### DataFrame

A two-dimensional labeled data structure with columns of potentially different types

```
>>> data = {'Country': ['Belgium', 'India', 'Brazil'],
           'Capital': ['Brussels', 'New Delhi', 'Brasília'],
           'Population': [11190846, 1303171035, 207847528]}
>>> df = pd.DataFrame(data,
                      columns=['Country', 'Capital', 'Population'])
```

## **Asking For Help**

>>> help(pd.Series.loc)

## Selection

Also see NumPy Arrays

## Getting

```
>>> s['b']
  -5
>>> df[1:1
   Country
             Capital Population
 1 India New Delhi 1303171035
 2 Brazil
            Brasília 207847528
```

### Get one element

Get subset of a DataFrame

## Selecting, Boolean Indexing & Setting

## **By Position**

```
>>> df.iloc([0],[0])
 'Belgium'
>>> df.iat([0],[0])
 'Belgium'
```

### **By Label**

```
>>> df.loc([0], ['Country'])
>>> df.at([0], ['Country'])
 'Belgium'
```

### **By Label/Position**

AF 40 [2]

/// UI.IX[Z]	
Country Brazil	
Capital Brasília	
Population 207847528	
>>> df.ix[:,'Capital']	
0 Brussels	
1 New Delhi	
2 Brasília	

>>> df.ix[1,'Capital']

'New Delhi'

## **Boolean Indexing**

C-4	uta a
>>>	df[df['Population']>120000000
>>>	s[(s < -1)   (s > 2)]
>>>	s[~(s > 1)]

## Setting

	o [	'a']	_	6	
>>>	SĮ	'a']	=	Ю	

## Select single value by row & column

Select single value by row & column labels

### Select single row of subset of rows

Select a single column of subset of columns

Select rows and columns

## Series s where value is not >1 s where value is <-1 or >2

001 Use filter to adjust DataFrame

Set index a of Series s to 6

## Read and Write to SQL Query or Database Table

## >>> pd.read csv('file.csv', header=None, nrows=5) >>> df.to csv('myDataFrame.csv')

### Read and Write to Excel

Read and Write to CSV

```
>>> pd.read excel('file.xlsx')
>>> pd.to excel('dir/myDataFrame.xlsx', sheet name='Sheet1')
```

### Read multiple sheets from the same file

```
>>> xlsx = pd.ExcelFile('file.xls')
>>> df = pd.read excel(xlsx, 'Sheet1')
```

>>> from sqlalchemy import create engine

>>> engine = create engine('sglite:///:memory:') >>> pd.read sql("SELECT \* FROM my table;", engine)

>>> pd.read sql table('my table', engine)

>>> pd.read sql query("SELECT \* FROM my table;", engine)

read sql() is a convenience wrapper around read sql table() and read sql query()

>>> pd.to sql('myDf', engine)

## **Dropping**

```
>>> s.drop(['a', 'c'])
                                   Drop values from rows (axis=0)
>>> df.drop('Country', axis=1) Drop values from columns(axis=1)
```

### **Sort & Rank**

```
>>> df.sort index()
                                           Sort by labels along an axis
>>> df.sort values(by='Country')
                                           Sort by the values along an axis
>>> df.rank(\overline{1})
                                           Assign ranks to entries
```

## **Retrieving Series/DataFrame Information**

### **Basic Information**

```
>>> df.shape
                             (rows.columns)
>>> df.index
                             Describe index
>>> df.columns
                             Describe DataFrame columns
                            Info on DataFrame
>>> df.info()
                            Number of non-NA values
>>> df.count()
```

### Summary

```
Sum of values
>>> df.sum()
>>> df.cumsum()
                                Cummulative sum of values
                                Minimum/maximum values
>>> df.min()/df.max()
                               Minimum/Maximum index value
>>> df.idxmin()/df.idxmax()
>>> df.describe()
                                Summary statistics
                                Mean of values
>>> df.mean()
>>> df.median()
                                Median of values
```

## **Applying Functions**

```
>>> f = lambda x: x*2
                            Apply function
>>> df.apply(f)
                            Apply function element-wise
>>> df.applymap(f)
```

## **Data Alignment**

## Internal Data Alignment

NA values are introduced in the indices that don't overlap:

```
>>> s3 = pd.Series([7, -2, 3], index=['a', 'c', 'd'])
>>> s + s3
       10.0
       NaN
       5.0
 С
       7.0
```

## Arithmetic Operations with Fill Methods

You can also do the internal data alignment yourself with the help of the fill methods:

```
>>> s.add(s3, fill value=0)
 a 10.0
     -5.0
     5.0
 C
 d
     7.0
>>> s.sub(s3, fill value=2)
>>> s.div(s3, fill value=4)
>>> s.mul(s3, fill value=3)
```

## **DataCamp**

## Scikit-Learn

Learn Python for data science Interactively at www.DataCamp.com

## Scikit-learn

Scikit-learn is an open source Python library that implements a range of machine learning, preprocessing, cross-validation and visualization algorithms using a unified interface.

## A Basic Example

```
>>> from sklearn import neighbors, datasets, preprocessing
>>> from sklearn.model selection import train test split
>>> from sklearn.metrics import accuracy score
>>> iris = datasets.load iris()
>>> X, y = iris.data[:, :2], iris.target
>>> X_train, X_test, y_train, y_test = train_test_split(X, y, random_state=33)
>>> scaler = preprocessing.StandardScaler().fit(X train)
>>> X train = scaler.transform(X train)
>>> X test = scaler.transform(X test)
>>> knn = neighbors.KNeighborsClassifier(n neighbors=5)
>>> knn.fit(X train, y train)
>>> y pred = knn.predict(X test)
>>> accuracy score(y test, y pred)
```

## **Loading The Data**

### Also see NumPy & Pandas

Your data needs to be numeric and stored as NumPy arrays or SciPy sparse matrices. Other types that are convertible to numeric arrays, such as Pandas DataFrame, are also acceptable.

```
>>> import numpy as np
>>> X = np.random.random((10,5))
>>> X[X < 0.7] = 0
```

## **Training And Test Data**

```
>>> from sklearn.model_selection import train_test_split
>>> X train, X test, y train, y test = train test split(X,
                                                  random state=0)
```

## **Create Your Model**

### Supervised Learning Estimators

### Linear Regression

```
>>> from sklearn.linear model import LinearRegression
>>> lr = LinearRegression(normalize=True)
```

### Support Vector Machines (SVM)

```
>>> from sklearn.svm import SVC
>>> svc = SVC(kernel='linear')
```

### Naive Baves

>>> from sklearn.naive bayes import GaussianNB >>> gnb = GaussianNB()

### KNN

>>> from sklearn import neighbors >>> knn = neighbors.KNeighborsClassifier(n neighbors=5)

### Unsupervised Learning Estimators

### Principal Component Analysis (PCA)

```
>>> from sklearn.decomposition import PCA
>>> pca = PCA(n components=0.95)
```

### K Means

- >>> from sklearn.cluster import KMeans
- >>> k means = KMeans(n clusters=3, random state=0)

## **Model Fitting**

### Supervised learning

>>> lr.fit(X, y) >>> knn.fit(X train, y train)

### >>> svc.fit(X train, y train) Unsupervised Learning

- >>> k means.fit(X train)
- >>> pca model = pca.fit transform(X train) | Fit to data, then transform it

### Fit the model to the data

Fit the model to the data

## Prediction

## **Supervised Estimators**

- >>> y pred = svc.predict(np.random.random((2,5))) >>> y pred = lr.predict(X test)
- >>> y pred = knn.predict proba(X test)

## Unsupervised Estimators

>>> y pred = k means.predict(X test)

### Predict labels Predict labels Estimate probability of a label

Predict labels in clustering algos

## **Preprocessing The Data**

### Standardization

- >>> from sklearn.preprocessing import StandardScaler
- >>> scaler = StandardScaler().fit(X train) >>> standardized X = scaler.transform(X train)
- >>> standardized X test = scaler.transform(X test)

### Normalization

- >>> from sklearn.preprocessing import Normalizer >>> scaler = Normalizer().fit(X train) >>> normalized X = scaler.transform(X train)
- >>> normalized X test = scaler.transform(X test)

### Binarization

- >>> from sklearn.preprocessing import Binarizer >>> binarizer = Binarizer(threshold=0.0).fit(X)
- >>> binary X = binarizer.transform(X)

## **Encoding Categorical Features**

- >>> from sklearn.preprocessing import LabelEncoder
- >>> enc = LabelEncoder()
- >>> y = enc.fit transform(y)

## Imputing Missing Values

- >>> from sklearn.preprocessing import Imputer
- >>> imp = Imputer(missing values=0, strategy='mean', axis=0)
- >>> imp.fit transform(X train)

## Generating Polynomial Features

- >>> from sklearn.preprocessing import PolynomialFeatures
- >>> poly = PolynomialFeatures(5)
- >>> poly.fit transform(X)

## **Evaluate Your Model's Performance**

### **Classification Metrics**

### **Accuracy Score**

- >>> knn.score(X test, y test)
- >>> from sklearn.metrics import accuracy score Metric scoring functions
- >>> accuracy score(y test, y pred)

### Classification Report

>>> from sklearn.metrics import classification report Precision, recall, fi-score >>> print(classification report(y test, y pred)) and support

### **Confusion Matrix**

>>> from sklearn.metrics import confusion\_matrix >>> print(confusion\_matrix(y\_test, y\_pred))

### Regression Metrics

### Mean Absolute Error

- >>> from sklearn.metrics import mean absolute error
- >>> y true = [3, -0.5, 2]>>> mean\_absolute\_error(y\_true, y\_pred)

- Mean Squared Error >>> from sklearn.metrics import mean squared error
- >>> mean squared error(y test, y pred)

- >>> from sklearn.metrics import r2 score
- >>> r2 score(y true, y\_pred)

# Clustering Metrics

### **Adjusted Rand Index**

>>> from sklearn.metrics import adjusted rand score >>> adjusted rand score(y true, y pred)

### Homogeneity

- >>> from sklearn.metrics import homogeneity score
- >>> homogeneity score(y true, y pred)

>>> from sklearn.metrics import v measure score >>> metrics.v measure score(y true, y pred)

### **Cross-Validation**

- >>> from sklearn.cross validation import cross val score
- >>> print(cross val score(knn, X train, y train, cv=4)) >>> print(cross val score(lr, X, y, cv=2))

## **Tune Your Model**

## **Grid Search**

- >>> from sklearn.grid search import GridSearchCV
- >>> params = {"n neighbors": np.arange(1,3), "metric": ["euclidean", "cityblock"]}
- >>> grid = GridSearchCV(estimator=knn, param grid=params)
- >>> grid.fit(X train, y train) >>> print(grid.best score )
- >>> print(grid.best\_estimator .n neighbors)

## Randomized Parameter Optimization

- >>> from sklearn.grid search import RandomizedSearchCV
- >>> params = {"n neighbors": range(1,5),
- n iter=8,
  - random state=5)
- >>> rsearch.fit(X train, y train) >>> print(rsearch.best score )

### **DataCamp Learn Python for Data Science Interactively**

Estimator score method

# **Python For Data Science** Cheat Sheet Matplotlib

Learn Python Interactively at www.DataCamp.com

## Matplotlib

Matplotlib is a Python 2D plotting library which produces publication-quality figures in a variety of hardcopy formats and interactive environments across platforms.

# Prepare The Data

Also see Lists & NumPy

```
>>> import numpy as np
>>> x = np.linspace(0, 10, 100)
>>> v = np.cos(x)
>>> z = np.sin(x)
```

### 2D Data or Images

```
>>> data = 2 * np.random.random((10, 10))
>>> data2 = 3 * np.random.random((10, 10))
>>> Y, X = np.mgrid[-3:3:100j, -3:3:100j]
>>> U = -1 - X**2 + Y
>>> V = 1 + X - Y**2
>>> from matplotlib.cbook import get sample data
>>> img = np.load(get sample data('axes grid/bivariate normal.npy'))
```

## Create Plot

```
>>> import matplotlib.pyplot as plt
```

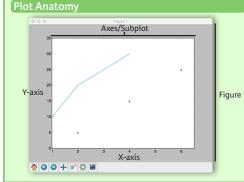

```
>>> fig = plt.figure()
>>> fig2 = plt.figure(figsize=plt.figaspect(2.0))
```

### Axes

All plotting is done with respect to an Axes. In most cases, a subplot will fit your needs. A subplot is an axes on a grid system.

```
>>> fig.add axes()
>>> ax1 = fig.add subplot(221) # row-col-num
>>> ax3 = fig.add subplot(212)
>>> fig3, axes = plt.subplots(nrows=2,ncols=2)
>>> fig4, axes2 = plt.subplots(ncols=3)
```

## Plot Anatomy & Workflow

### Workflow

```
The basic steps to creating plots with matplotlib are:
       1 Prepare data 2 Create plot 3 Plot 4 Customize plot 5 Save plot 6 Show plot
                >>> import matplotlib.pyplot as plt
                >>> x = [1,2,3,4]
               >>> y = [10, 20, 25, 30]
                >>> fig = plt.figure() < Step 2
                >>> ax = fig.add subplot(111) < Step 3
                >>> ax.plot(x, y, color='lightblue', linewidth=3) Step 3, 4
                >>> ax.scatter([2,4,6],
                                [5, 15, 25],
                                color='darkgreen',
                                marker='^')
```

# **Customize Plot**

### Colors, Color Bars & Color Maps

```
>>> plt.plot(x, x, x, x**2, x, x**3)
>>> ax.plot(x, y, alpha = 0.4)
>>> ax.plot(x, y, c='k')
>>> fig.colorbar(im, orientation='horizontal')
>>> im = ax.imshow(img,
                   cmap='seismic')
```

### Markers

>>>	fig, ax = plt.subplots()
>>>	<pre>ax.scatter(x,y,marker=".")</pre>
>>>	ax.plot(x,v,marker="o")

```
>>> plt.plot(x,y,linewidth=4.0)
>>> plt.plot(x,y,ls='solid')
>>> plt.plot(x,y,ls='--')
>>> plt.plot(x,y,'--',x**2,y**2,'-.')
>>> plt.setp(lines,color='r',linewidth=4.0)
```

### Text & Annotations

```
>>> ax.text(1,
            -2.1,
           'Example Graph',
           style='italic')
>>> ax.annotate("Sine",
                 xy = (8, 0),
                 xycoords='data'
                 xytext = (10.5, 0),
                 textcoords='data',
                 arrowprops=dict(arrowstyle="->".
                              connectionstyle="arc3"),)
```

### Mathtext

```
Limits, Legends & Layouts
```

>>> plt.show()

>>> ax.set xlim(1, 6.5)

>>> plt.savefig('foo.png')

Limits & Autoscaling

```
Add padding to a plot
>>> ax.margins(x=0.0,y=0.1)
>>> ax.axis('equal')
                                                            Set the aspect ratio of the plot to 1
>>> ax.set(xlim=[0,10.5],ylim=[-1.5,1.5])
                                                            Set limits for x-and v-axis
                                                            Set limits for x-axis
>>> ax.set xlim(0,10.5)
>>> ax.set(title='An Example Axes',
                                                            Set a title and x-and y-axis labels
             vlabel='Y-Axis',
             xlabel='X-Axis')
>>> ax.legend(loc='best')
                                                            No overlapping plot elements
```

### >>> ax.xaxis.set(ticks=range(1,5), Manually set x-ticks

```
ticklabels=[3,100,-12,"foo"])
>>> ax.tick params(axis='y',
                   direction='inout',
                   length=10)
```

>>> plt.title(r'\$sigma i=15\$', fontsize=20)

### Subplot Spacing

```
>>> fig3.subplots adjust(wspace=0.5,
                         hspace=0.3,
                         left=0.125,
                         right=0.9,
                         top=0.9,
                         bottom=0.1)
>>> fig.tight layout()
Axis Spines
```

>>> ax1.spines['top'].set visible(False)

Make y-ticks longer and go in and out

# Adjust the spacing between subplots

# Fit subplot(s) in to the figure area

### Make the top axis line for a plot invisible >>> ax1.spines['bottom'].set position(('outward', 10)) Move the bottom axis line outward

# Plotting Routines

### >>> fig, ax = plt.subplots() >>> lines = ax.plot(x,y) >>> ax.scatter(x,y)

>>> axes[0,0].bar([1,2,3],[3,4,5]) >>> axes[1,0].barh([0.5,1,2.5],[0,1,2]) >>> axes[1,1].axhline(0.45) >>> axes[0,1].axvline(0.65) >>> ax.fill(x,y,color='blue') >>> ax.fill between(x,y,color='yellow')

Draw points with lines or markers connecting them Draw unconnected points, scaled or colored Plot vertical rectangles (constant width) Plot horiontal rectangles (constant height)

Draw a horizontal line across axes Draw a vertical line across axes Draw filled polygons

Fill between v-values and o

# Vector Fields

>>> axes[1,1].quiver(y,z)	Add an arrow to the axes Plot a 2D field of arrows Plot a 2D field of arrows
---------------------------	--

### Data Distributions

>>> ax1.hist(y) >>> ax3.boxplot(y) >>> ax3.violinplot(z)	Plot a histogram Make a box and whisker plot Make a violin plot
--	---

### 2D Data or Images

>>> fig, ax = plt.subplots()

>>>	im :	=	ax.imshow(img,
			cmap='gist earth',
			interpolation='nearest'
			vmin=-2,
			vmav=2)

Colormapped or RGB arrays

>>>	axes2[0].pcolor(data2)
>>>	axes2[0].pcolormesh(data)
>>>	CS = plt.contour(Y, X, U)
>>>	axes2[2].contourf(data1)
>>>	2022[2]= 20 clabel(CS)

Pseudocolor plot of 2D array Pseudocolor plot of 2D array Plot contours Plot filled contours Label a contour plot

## Save Plot

Save figures >>> plt.savefig('foo.png') Save transparent figures >>> plt.savefig('foo.png', transparent=True)

## Show Plot

>>> plt.show()

## Close & Clear

>>> plt.cla()	Clear an axis
>>> plt.clf()	Clear the entire figure
>>> plt.close()	Close a window

# Python For Data Science Cheat Sheet (3) Plotting With Seaborn

Seaborn

Learn Data Science Interactively at www.DataCamp.com

### Statistical Data Visualization With Seaborn

The Python visualization library Seaborn is based on matplotlib and provides a high-level interface for drawing attractive statistical graphics.

Make use of the following aliases to import the libraries:

```
>>> import matplotlib.pyplot as plt
>>> import seaborn as sns
```

The basic steps to creating plots with Seaborn are:

- 1. Prepare some data
- 2. Control figure aesthetics
- 3. Plot with Seaborn
- 4. Further customize your plot

```
>>> import matplotlib.pyplot as plt
>>> import seaborn as sns
>>> tips = sns.load dataset("tips")
                                        Step 1
>>> sns.set style("whitegrid")
                                        Step 3
>>> g = sns.lmplot(x="tip",
                   v="total bill",
                   data=tips,
                   aspect=2)
>>> g = (g.set axis labels("Tip", "Total bill(USD)").
set(xlim=(0,10),ylim=(0,100))
>>> plt.title("title")
>>> plt.show(q)
```

# Data

### Also see Lists, NumPy & Pandas

```
>>> import pandas as pd
>>> import numpy as np
>>> uniform data = np.random.rand(10, 12)
>>> data = pd.DataFrame({'x':np.arange(1,101),
                          y':np.random.normal(0,4,100)})
```

### Seaborn also offers built-in data sets:

Figure Aesthetics

>>> sns.axes style("whitegrid")

```
>>> titanic = sns.load dataset("titanic")
>>> iris = sns.load dataset("iris")
```

### **Axis Grids**

```
>>> g = sns.FacetGrid(titanic,
                      col="survived",
                       row="sex")
>>> g = g.map(plt.hist, "age")
>>> sns.factorplot(x="pclass",
                   y="survived",
                   hue="sex",
                   data=titanic)
>>> sns.lmplot(x="sepal width",
               y="sepal length",
               hue="species",
               data=iris)
```

Subplot grid for plotting conditional relationships

Draw a categorical plot onto a Facetgrid

Plot data and regression model fits across a FacetGrid

```
>>> h = sns.PairGrid(iris)
                                         Subplot grid for plotting pairwise
>>> h = h.map(plt.scatter)
                                         relationships
>>> sns.pairplot(iris)
                                         Plot pairwise bivariate distributions
>>> i = sns.JointGrid(x="x",
                                         Grid for bivariate plot with marginal
                                         univariate plots
                        data=data)
>>> i = i.plot(sns.regplot,
                 sns.distplot)
                                         Plot bivariate distribution
>>> sns.jointplot("sepal length"
                     "sepal width",
                    data=iris,
```

### Categorical Plots

```
Scatterplot
                                                  Scatterplot with one
>>> sns.stripplot(x="species",
                                                  categorical variable
                    v="petal length",
                    data=iris)
>>> sns.swarmplot(x="species",
                                                  Categorical scatterplot with
                                                  non-overlapping points
                    y="petal length",
                    data=iris)
Bar Chart
                                                  Show point estimates and
>>> sns.barplot(x="sex",
                                                  confidence intervals with
                 y="survived",
                hue="class",
                                                  scatterplot glyphs
                 data=titanic)
Count Plot
                                                  Show count of observations
>>> sns.countplot(x="deck",
                   data=titanic,
                   palette="Greens d")
Point Plot
                                                  Show point estimates and
>>> sns.pointplot(x="class",
                                                  confidence intervals as
                    v="survived",
                                                  rectangular bars
                    hue="sex",
                    data=titanic,
                    palette={"male":"g",
                              "female": "m" },
                    markers=["^","o"],
                    linestyles=["-","--"])
Boxplot
```

## **Regression Plots**

```
Plot data and a linear regression
>>> sns.regplot(x="sepal width",
                                         model fit
                  v="sepal length",
                  data=iris,
                  ax=ax
```

kind='kde')

### **Distribution Plots**

```
>>> plot = sns.distplot(data.y,
                                         Plot univariate distribution
                           kde=False,
                           color="b")
```

### **Matrix Plots**

>>> sns.heatmap(uniform data,vmin=0,vmax=1) Heatmap

# **Further Customizations**

### **Axisarid Objects**

```
>>> g.despine(left=True)
                                         Remove left spine
>>> g.set ylabels("Survived")
                                        Set the labels of the y-axis
>>> g.set xticklabels(rotation=45
                                        Set the tick labels for x
                                        Set the axis labels
>>> g.set axis labels("Survived",
                          "Sex")
                                        Set the limit and ticks of the
>>> h.set(xlim=(0,5),
           ylim = (0, 5),
                                        x-and y-axis
           xticks=[0,2.5,5],
           yticks=[0,2.5,5])
```

### Plot

>>> plt.title("A Title") >>> plt.ylabel("Survived")	Add plot title Adjust the label of the y-axis
>>> plt.xlabel("Sex")	Adjust the label of the x-axis
>>> plt.ylim(0,100)	Adjust the limits of the y-axis
>>> plt.xlim(0,10)	Adjust the limits of the x-axis
>>> plt.setp(ax,yticks=[0,5])	Adjust a plot property
>>> plt.tight_layout()	Adjust subplot params

## Also see Matplotlib

Boxplot

Violin plot

Boxplot with wide-form data

```
>>> f, ax = plt.subplots(figsize=(5,6)) Create a figure and one subplot
Seaborn styles
                                            (Re)set the seaborn default
>>> sns.set()
                                           Set the matplotlib parameters
>>> sns.set style("whitegrid")
>>> sns.set style("ticks",
```

{"xtick.major.size":8,

"vtick.major.size":8})

Set the matplotlib parameters

Return a dict of params or use with with to temporarily set the style

## Context Functions

**Violinplot** 

>>> sns.boxplot(x="alive",

>>> sns.violinplot(x="age",

v="age",

>>> sns.boxplot(data=iris,orient="h")

hue="adult male",

data=titanic)

y="sex", hue="survived",

data=titanic)

1	 	
	<pre>sns.set_context("talk") sns.set_context("notebook",</pre>	Set context to "talk" Set context to "notebook",
1	font_scale=1.5, rc={"lines.linewidth":2.5})	scale font elements and override param mapping

### **Color Palette**

		<pre>sns.set_palette("husl",3)</pre>	Define the color palette
	>>>	sns.color palette("husl")	Use with with to temporarily set palette
ı	>>>	flatui = ["#9b59b6","#3498db",	"#95a5a6","#e74c3c","#34495e","#2ecc71"]
	>>>	sns.set palette(flatui)	Set your own color palette

# Show or Save Plot

>>>	plt.show()
>>>	plt.savefig("foo.png")
>>>	plt.savefig("foo.png",
	transparent=True)

Show the plot Save the plot as a figure Save transparent figure

# Close & Clear

## Bokeh

Learn Bokeh Interactively at <a href="www.DataCamp.com">www.DataCamp.com</a>, taught by Bryan Van de Ven, core contributor

## **Plotting With Bokeh**

The Python interactive visualization library **Bokeh** enables high-performance visual presentation of large datasets in modern web browsers.

Bokeh's mid-level general purpose bokeh.plotting interface is centered around two main components: data and glyphs.

The basic steps to creating plots with the bokeh.plotting interface are:

1. Prepare some data:

Python lists, NumPy arrays, Pandas DataFrames and other sequences of values

- 2. Create a new plot
- 3. Add renderers for your data, with visual customizations
- 4. Specify where to generate the output
- 5. Show or save the results

## 1) Data

### Also see Lists, NumPy & Pandas

Under the hood, your data is converted to Column Data Sources. You can also do this manually:

## 2) Plotting

>>> cds df = ColumnDataSource(df)

## Glyphs

### 

color="blue")

pd.DataFrame([[3,4,5],[3,2,1]]),

### **Customized Glyphs**

### Also see Data

## **Selection and Non-Selection Glyphs**

**Renderers & Visual Customizations** 

### **Hover Glyphs**

- >>> from bokeh.models import HoverTool
  >>> hover = HoverTool(tooltips=None, mode='vline')
  >>> p3.add tools(hover)

### Colormapping

## **Legend Location**

### Legend Orientation

```
>>> p.legend.orientation = "horizontal"
>>> p.legend.orientation = "vertical"
```

## Legend Background & Border

```
>>> p.legend.border_line_color = "navy"
>>> p.legend.background_fill_color = "white"
```

## Rows & Columns Layout

```
Rows
>>> from bokeh.layouts import row
>>> layout = row(p1,p2,p3)

Columns
>>> from bokeh.layouts import columns
>>> layout = column(p1,p2,p3)

Nesting Rows & Columns
>>>layout = row(column(p1,p2), p3)
```

### **Grid Layout**

```
>>> from bokeh.layouts import gridplot
>>> row1 = [p1,p2]
>>> row2 = [p3]
>>> layout = gridplot([[p1,p2],[p3]])
```

### Tabbed Layout

```
>>> from bokeh.models.widgets import Panel, Tabs
>>> tab1 = Panel(child=p1, title="tab1")
>>> tab2 = Panel(child=p2, title="tab2")
>>> layout = Tabs(tabs=[tab1, tab2])
```

### Linked Plots

# Output & Export

### Notebook

```
>>> from bokeh.io import output_notebook, show >>> output notebook()
```

### HTML

### Standalone HTML

```
>>> from bokeh.embed import file html
>>> from bokeh.resources import CDN
>>> html = file_html(p, CDN, "my_plot")
```

```
>>> from bokeh.io import output_file, show
>>> output file('my bar chart.html', mode='cdn')
```

### Components

```
>>> from bokeh.embed import components
>>> script, div = components(p)
```

### **PNG**

```
>>> from bokeh.io import export_png
>>> export png(p, filename="plot.png")
```

### SVG

```
>>> from bokeh.io import export_svgs
>>> p.output_backend = "svg"
>>> export_svgs(p, filename="plot.svg")
```

# 5) Show or Save Your Plots

•	/		e.
			r
	>>> show(p1)	>>> show(layout)	
	>>> save(p1)	>>> save(layout)
